

BorderPatrol 5.0

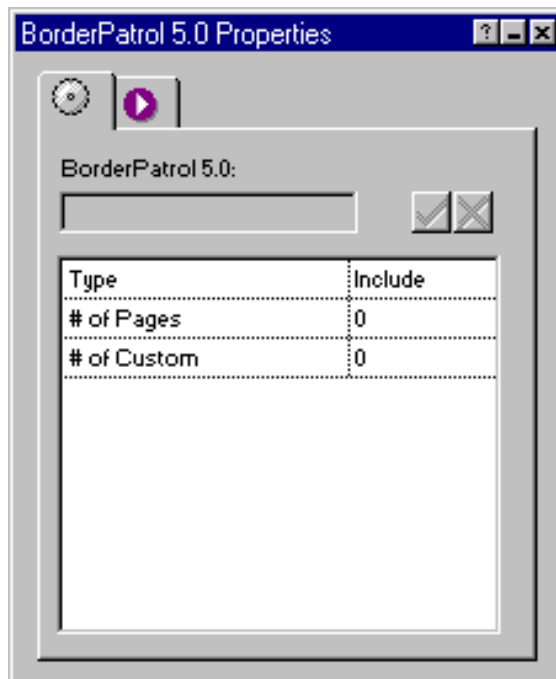

Getting Started

BorderPatrol is a NetObjects Fusion v4.0/5.0 component which lets you place an image onto your MasterBorder that can be customized to one or more specific pages. The same MasterBorder displays differently on different pages.

Getting started with the BorderPatrol:

- Run the Installation program, specifying the location of Fusion 4.0/5.0's component directory.
- Launch Fusion
- If the coolmaps.com component toolbar is not visible choose View > Toolbars > Component Tools > coolmaps.com components
- Select the BorderPatrol component and drag out an area on the master border (this graphic does not appear on the published page).
It is important that Border Patrol be placed in the Master Border.

The BorderPatrol properties now appears in Fusion's properties palette.

BorderPatrol Options

Type, the first option on the Properties Palette lets you choose how you would like to select the pages to show the image.

Your choices are:

- Include, if you want to select the specific pages which have the image. Choose this option if there are, say, 100 pages, and you want the image to show on, say, 3 of those pages.
- Exclude, if you want to select the specific pages which DO NOT have the image. Choose this option if there are, say, 100 pages, and you want the image to show on all but 3 of them.

of Pages this option is where you select the number of pages you want to include or exclude (whatever you specified above). If you set "# of Pages" to zero, no pages will be included or excluded and the only pages that will display images will be the ones specified as custom pages (see below).

Image - here you select the default image that shows up on all pages that have been included (or not excluded). This option will only appear if you select a number greater than 0 for "# of Pages"

Link - this is the default link for the default image specified above.

Page # is where you enter the specific pages you would like to include or exclude.

of custom - here you specify how many pages you want to have custom images. These images over-ride the include/exclude settings above.

C Image, C Link, C Page - these fields allow you to enter the image, link, and pages associated with each custom page image.
