

## TagFix 5.0 to the Rescue!

TagFix 5.0 corrects a popular power user link target shortcut that no longer works in Fusion v5.0. TagFix is free\* to all users of NetObjects Fusion.

To create a targeted link users could use this shortcut in the External Link dialogue:

```
http://www.mydomain.com" target="_mytarget
```

On generating the page, Fusion previously added the beginning and ending " to close the link e.g.

```
"http://www.mydomain.com" target="_mytarget"
```

Job Done! Unfortunately this is broken in Fusion v5.0. The resulting code that Fusion generates is:

```
"http://www.mydomain.com' target='_blank"
```

This results in a broken link. Enter Coolmaps TagFix 5.0!

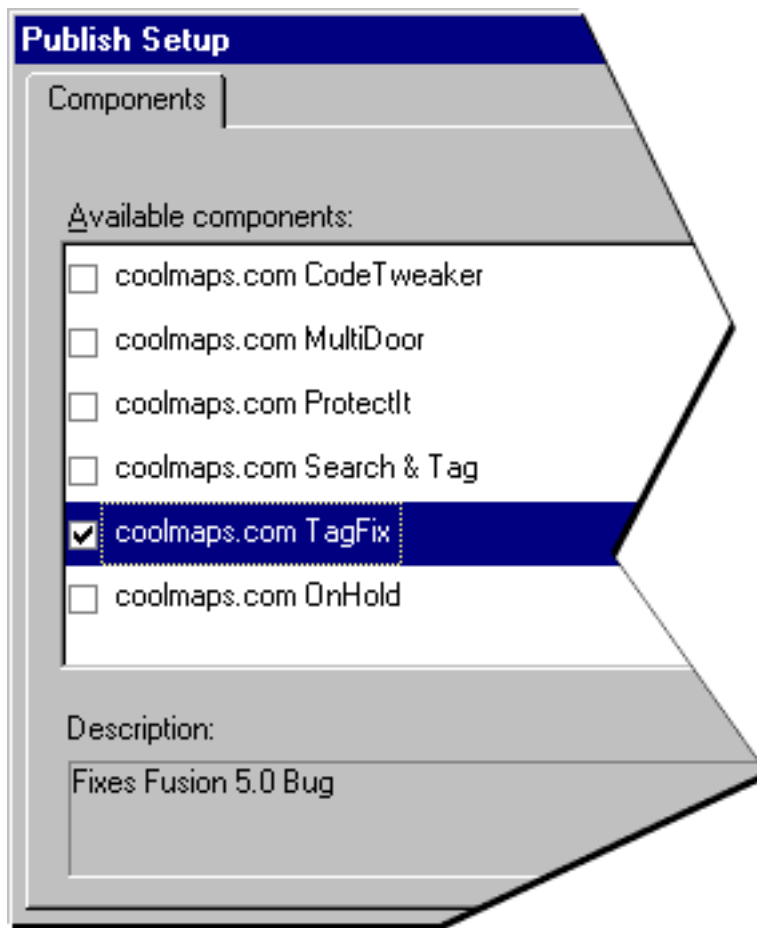

NOTE: This component is for NetObjects Fusion v5.0. It is not required in Fusion v4.01.

To get started with TagFix:

- Run the TagFix Installation program, specifying the location of Fusion 4.0/5.0's component directory.
- Launch Fusion

TagFix is a 'post publish' component. It does not appear on the coolmaps.com component bar in Page view. TagFix is enabled in Publish View.

- Choose Publish View > Publish > Publish Components

When Fusion generates your site, TagFix (when activated) will parse the code and correct every instance of the broken link shortcut.
